

ALGAE PROCESSING PLANT CONCEPT

Algae “eats” carbon dioxide and emits oxygen as a waste product; CO2 can be obtained from a variety of sources such as factories and power plants. It can grow in wastewater, leaving clean water behind. Many operations can’t even give this waste by-product away.

Community based job training grants are being awarded to local colleges in order to implement innovative job training programs that focus around new technologies. CBO Financial and the Algaepreneur can help the institution implement this program.
